

the right Tools

to help healthcare staff reduce HAI's

TPorter TEE Probe Procedure Case

CS Medical and the TEE Complete Care™ line of products provide many different solutions to the everyday problems that healthcare workers encounter when reprocessing TEE ultrasound probes.

Job: Transporting the high-level disinfected TEE from the reprocessing area to the point of use

Why: A contaminate free TEE ultrasound probe is critical to ensure patient safety from potentially harmful particulates, viruses and pathogens. Also, moving the probe within a case that minimizes distal tip damage is important.

Solution: TPorter™ TEE Probe Procedure Case

TPorter is designed with a variety of molded compartments to accommodate the TEE ultrasound probe, bite block(s), a PullUp™ Bio-Barrier Sleeve and a TEEZyme™ enzymatic sponge. Carried just like a suitcase or placed into the TransPorter™, a multiple compartment utility cart, TPorter solves the current issues associated with TEE ultrasound probe transportation. The TPorter transport case provides a standardized method for delivering the necessary components to the procedure room. TPorter TEE Ultrasound Probe Procedure Case promotes good practice to ensure each TEE Ultrasound Probe is handled safely and effectively to minimize HAI's and probe damage.
